## Which doc, when?

Quick map to help you navigate the course materials. You'll see several files in this repo – each one is the right doc for a different moment in the course.

### At a glance

| When                               | Open this                                                            | Have this open alongside                                                            |
|------------------------------------|----------------------------------------------------------------------|-------------------------------------------------------------------------------------|
| Before class (days leading up)     | <code>docs/before_class.md</code> – the pre-class checklist          | <code>docs/setup_walkthrough.md</code> – only if a step in the checklist is unclear |
| First time you clone this repo     | <code>README.md</code> – the front door, 5-minute orientation        | –                                                                                   |
| Right before Module 1 starts       | <code>docs/how_a_module_works.md</code> – the rhythm of every module | –                                                                                   |
| During each module (Modules 1-8)   | <code>dist/module_NN_*/README.md</code> for that module              | The crash course PDF from your instructor                                           |
| End of the course (after Module 8) | <code>docs/publish_your_work.md</code> – publish your V1 fork        | –                                                                                   |

### The pair that matters most

During each module you have two surfaces open at the same time:

- **`dist/module_NN_*/README.md`** in your editor (Antigravity) – the **doing-side**. Run the commands, read the file, ask Gemini, defend the answer.
- **The crash course PDF** (the one your instructor sent you) – the **understanding-side**. The 55-page narrative that explains *why* each module does what it does.

A student who only opens the module README ends up typing commands without grasping why. A student who only reads the crash course follows the storyline without producing code. You need both. They are not redundant – they do different jobs.

### What each doc is for

| Doc                    | What it does                                                               |
|------------------------|----------------------------------------------------------------------------|
| <code>README.md</code> | The front door – what the course is, the 5-step Class Flow, the module map |

| Doc                            | What it does                                                                                          |
|--------------------------------|-------------------------------------------------------------------------------------------------------|
| docs/before_class.md           | Pre-class checklist: accounts, mobile apps, tools, AntigraVity, Gemini API key, Render + Vercel       |
| docs/setup_walkthrough.md      | Longer hand-holding install walkthrough. Open only when a step in before_class.md needs more detail.  |
| docs/how_a_module_works.md     | The recurring nine-step shape of every coding module                                                  |
| dist/module_NN_*/README.md × 9 | One per module – Run / Read / Ask Gemini / Defend It, plus an optional Tweak                          |
| docs/publish_your_work.md      | End of course: publish your V1 fork as a portfolio piece on your own GitHub                           |
| AGENTS.md                      | Gemini's coaching rules – loaded automatically by AntigraVity. You don't read this; Gemini does.      |
| The crash course PDF           | The narrative companion – open alongside each module. Delivered by your instructor outside of GitHub. |

## "I don't know which doc to open right now"

Match what you're trying to do:

- **Setting up, installs not working** → docs/before\_class.md first; docs/setup\_walkthrough.md if a step needs more detail.
- **At Module 0, trying to verify everything works** → run verify\_setup.sh from inside dist/module\_00\_setup/ – the canonical 8-check oracle.
- **Working through Modules 1-8** → that module's own README, plus the crash course PDF, both open.
- **Finished Module 8, want to ship your portfolio piece** → docs/publish\_your\_work.md.
- **Just want to know what the course IS** → the cohort README.md.

When in doubt, ask Gemini in the AntigraVity chat panel – AGENTS.md makes it aware of all of these.
